Overview	Features	Benefits
<p>Our pmcConnect solution is based on 15+ years implementing SAP ERP in the automotive and manufacturing industry. This gives us the unique skill set building and maintaining a fully SAP ERP integrated but still modular EDI solution.</p>	<p>Project and Program Management: Project Management tools get used throughout every EDI deployment project.</p> <p>Analysis and MRS: We understand not only the technical side of EDI, but also how it has to function in your SAP ERP environment. Every trading partner transaction set combination has its unique MRS (mapping requirement specification) document.</p> <p>Mapping: Either we can do the EDI Mappings using our vast template library built on GXS TLE (inovia), or we can work with your Translation supplier using our MRS documents.</p> <p>Customer specific business logic packages: Every customer sends you different EDI contents which results in various business logic requirements being applied to EDI data. We have built business logic packages which reside in SAP as rule based setups to cover all of the customer requirements.</p> <p>SAP Application Integration: Not only do we bring in EDI messages from the customer, we are also the experts in how they have to be integrated in the various SAP Applications (Orders, Scheduling Agreement, 3rd Party, JIT calls, etc.)</p> <p>SAP Add-on's: Specific pmc add-on's, like the Shipping Cockpit and the Logistics Execution Cockpit bring additional required functionality to the backend customer processes. These ensure a checks-and-balances for the vital EDI outbound processes.</p>	<p>Reduce risk for your SAP deployment</p> <p>Don't do custom development... we already have done the development for you</p> <p>SAP Integration skill set</p> <p>Honda Certification</p>
